*Abstract— The Constitution of India, under its Eight Schedule, has recognized Hindi (in Devanagari Script) and English as Official languages of Union Government, along with other 22 languages as Scheduled languages and given status and official encouragement to these Scheduled Languages. Most of the Optical recognition research work has been done on Devanagari, Telugu, and Bangla scripts etc. Development of OCR system for Indian scripts has many application areas like preservation of ancient manuscripts and literature written in different Indian scripts and making these available through digital libraries. Feature extraction and classification are the essential steps in the process of character recognition that affects the overall accuracy of the recognition system. This paper gives a detailed overview of feature extraction and classification techniques for the character recognition process of Indian scripts done in over past few decades*

*Index Terms— Optical Character Recognition (OCR), Feature Extraction, Classification.*

## I. INTRODUCTION

The history of OCR goes back in 1923. Tausheck [21] and 1933 Handel [22] gave the first idea of the concept of the OCR. Optical Character Recognition deals with the problem of recognizing optically processed characters. Optical recognition is an offline process i.e. the recognition starts after writing or printing has been completed. Hand printed and machine printed characters both can be recognized, but the performance of recognition is directly dependent upon the other input parameters, which includes the quality of the Input image. Over the last few decades character recognition research has gained a considerable attention, because preserving the handwritten/ machine printed text in to digitized format has become prevalent.

Out of around 33 different languages and 2000 dialects spoken in India, two languages are official and 20 are recognized as Scheduled Languages. The use of multi-lingual documents has increased which necessitates the intelligent extraction of features and use of classification techniques for achieving maximum accuracy and performance and minimum error rate in recognition process. An Optical Character recognition system comprises of the following steps.

### 1.1 Image acquisition: -

Digital imaging or digital image acquisition is the creation of digital images. With the help of scanning process digital image of the document is captured.

### 1.2 Pre-processing: -

Digital image obtained from scanning may contain some amount of noise depending upon the quality of scanner. The lines might be skewed or characters may be smeared or broken. Thus, pre-processing is required which involves elimination of noise, Binarization of the image and segmentation (line, word and character level).

### 1.3 Feature Extraction: -

The objective of feature extraction is to capture the essential characteristics of the symbols. Being the most important and crucial step of the recognition process, selection of the feature extraction technique becomes important factor in achieving the high recognition performance. It can be said to be one of the most difficult problems of pattern recognition. Some feature extraction

methods are Template matching, Deformable Templates, Zoning, Projection Histogram, Contour Profile, Moments calculation (Ex- Geometrical, Moments, Zernike).

#### 1.4 Classification: -

Classification is the process of assigning the sensed data to their corresponding class with respect to groups with homogeneous characteristics, with the aim of discriminating multiple objects from each other within the image. Classification is carried out on the basis of stored features in the feature space, such as structural features, global features etc. It can be said that classification divides the feature space into several classes based on the decision rule. Some classification techniques used in previously developed Optical character recognition systems are Neural Network, Support Vector Machine, K-Nearest Neighbors, Bayesian Classification, and Decision Tree Classification.

#### 1.5 Post-processing: -

Post-processing step involves grouping of symbols. The process of performing the association of symbols into strings is referred to as grouping.

#### FEATURE EXTRACTION AND CLASSIFICATION TECHNIQUES USED IN THE OCR SYSTEMS FOR INDIAN SCRIPTS

Veena Bansal and R.M.K Sinha [1] presented a complete OCR for printed Hindi text written in Devanagari script. The system used following features: Coverage of the region of the core strip, Vertical bar feature, Horizontal zero crossings, Number of positions of the vertex points, Moments, Structural descriptors of the characters for classification, Tree classifiers are used. Overall accuracy obtained at the character level is 93%. Sinha and Mahabala [2] designed a syntactic pattern analysis system for

Devanagari script recognition. The system stores structural descriptors for each symbol of the script. They achieved 90% accuracy. Reena, Lipika and Chaudhury [14] have tried to exploit information about stylistic variations, similarity between numerals and style invariant features. They presented a approach for recognition of handwritten Devnagari numerals using multiple neural classifiers. Sandhya Arora [15] have used Intersection features with Neural Network for Devanagari script and achieved 89.12% accuracy

Singh and Budhiraja [3] presented an OCR system for handwritten isolated Gurumukhi script using Zoning, Projection histogram, Distance profile features, and Background directional features and used Support Vector Machines (SVM) for classification and thus obtained 95.04% of overall accuracy. Further Geeta and Rani [4] represented an OCR system for Gurumukhi numerals using Zone Distance features and SVM classifier and achieved 99.73% accuracy.

G. S. Lehal and Chandan Singh [16] directed their efforts towards development of OCR system for Gurumukhi. They used Local features (concave/convex parts, number of endpoints, branches, joints) and Global features (connectivity, projection profiles, number of holes etc.). For classification hybrid classification technique, binary decision tree and nearest neighbour was used. They achieved a recognition rate of 91.6%. Dharamveer Sharma and Puneet Jhajj [17] used zoning feature with hybrid classification technique using KNN and SVM classifier and achieved 72.7% accuracy.

A very influential attempt made by the Jalal, Feroz and Choudhuri [5] for Bangla script. They represent neural network classifier by using Bounded rectangle calculation, Chain code generation, Slope distribution generation features. They achieved 96% system accuracy. Chaudhuri and Paul [6] represent an OCR system to recognize Bangla and Devanagari using stroke and shaded portion feature with tree classifier. U. Bhattacharya, M. Shridhar, and S.K. Paruil [18] implemented Neural network classifier for isolated Bangla characters with chain code features and achieved 92.14% accuracy on testing sets and 94.65% on training sets.

Negi and Chakravarthy [7] represent an OCR system with 92% performance using template matching, fringe distance for Telegu script. Another attempt was

made by Lakshmi and Patvardhan [8] for Telegu script. They used neural classifier by using directional features and they achieved 92% accuracy. Arun K Pujari, and C Dhanunjaya Naidu [19] implemented an adaptive character recognizer for Telugu scripts using Multi resolution Analysis. They represented DNN (Dynamic Neural Network) using Wavelet analysis and achieved 93.46 % success rate.

In south India, Telegu and Kannada have similar scripts. R Sanjeev and R D Sudhakar[9] represent an OCR system for printed Kannada Script using two stage Multi-Network (Neural Network) classification technique employing wavelet feature and achieved 91% accuracy at character level. M Sagar, Shobha and Ramakanth [10] designed a syntactical analysis system using Ternary Tree based classification for isolated Kannada characters. They have given more emphasis on Post-processing step, using dictionary based approach to increase the OCR accuracy. T V Ashwin and P S Sastry [20] represents a font and size-independent OCR system for printed Kannada documents using support vector machines (SVM). B Chaudhuri U Pal and Mitra [11] gave a prototype OCR system for Oriya script. They use Directional features and Global Features and classified them using Decision tree classifier and achieved 96.03% accuracy at character level.

Junaid, Umar, and Muhammad Umair [12] attempted to make an OCR system for isolated Urdu characters using NN classifier using structural features like width, height and checksum of the character. Their prototype gained the accuracy of 97.43%. A good attempt was made by Jhuwair and Abdul [13] for Urdu script. They achieved the 97.12% recognition rate using Sliding window and Hu-moment feature using KNN classifier.

#### CONCLUSION WITH COMPARISON TABLE

Survey represents a study of feature extraction methods with different classifiers implemented in OCR systems for different Indian scripts. Variance between the features should be clearly discriminative and specific so that system can classify the characters with maximum efficiency and minimum error rate. This survey paper helps researchers and developers to understand history of the OCR research work for Indian scripts. OCR for Indian scripts that works under all possible conditions and gives highly accurate results still remains a highly challenging task to implement.

SNo	Language	Feature Extraction Methods	Classification Methods	Recognition Rate (in %age)
1	Devanagari	Vertical Feature Bar, Horizontal Zero Crossing, No of positions on the vertex point, Moment Structural descriptors [1]	Tree Classifier	93
2	Devanagari	Syntactical Analysis[2]	Tree Classifier	90
3	Devanagari	Intersection Features [15]	Neural	89.12
4	Gurumukhi	Local Features - concave/convex parts, number of endpoints, branches, joints, Global features - connectivity, projection profiles, number of holes	Binary Decision Tree and nearest neighbour	91.6
5	Gurumukhi	Zoning Feature [17]	KNN and SVM classifier	72.7
6	Gurumukhi	Zoning, Projection Histogram, Distance Profile Features, Background Directional Features [3]	Support Vector Machines (SVM)	95.05
7	Gurumukhi	Zone Distance Features [4]	Neural Network	99.73
8	Bangla	Bounded Rectangle Calculation, Chain Code Generation, Slope Distribution Generation [5]	Decision Tree	96
9	Bangla	Directional Features [6]	Neural Network	-
10	Bangla	Chain code [18]	Neural Network	92.14
11	Telugu	Template Matching using Fringe Distance [7]	Neural Network	92
12	Telugu	Directional Features, Global Features [8]	Neural Network	92
13	Telugu	Wavelet Analysis [19]	DNN	93.46
14	Kannada	Wavelet Features, Syntactical Analysis[9]	Neural Network, Ternary Tree	91
15	Oriya	Directional Features, Global Features [11]	Decision Tree	96.73
16	Urdu	Structural Features (width, height ad checksum) [12]	Neural Network	97.43
17	Urdu	Sliding Window, Hu-moment [13]	KNN	97.12
